

## HW #9

Max points – 20

### TODO:

Continue to work with your custom module, but do other things like:

1. Uninstall your currently enabled module.
2. Rename your module to another name which you like. (**task 1**)
3. Link configuration page to your test page. (**task 2**)
4. Continue to work with our poll and provide validation and “**drupal\_set\_message**” on submit for fields:
  - *checkbox* (**task 3**)
  - *checkboxes* (**task 4**)
  - *machine\_name* (**task 5**)
  - *select* (**task 6**)
  - *textarea* (**task 7**)
  - *textfield* (**task 8**)
5. You should use parameters “**access callback**” and “**access arguments**” to provide some access check for your page. As example you can make it accessible only for authenticated users. (**task 9**)

**Important note!!!** Follow coding standards. Write comments for your code. Use function `t()` and `format_string()` when it's necessary. (**task 10**)

And have a nice week :)
